

Protocol for Genomic Testing of Patients with a Diagnosis of Prostate Cancer (R430)

The below algorithm has been created for urology teams to identify patients diagnosed with prostate cancer who are eligible for germline mutation testing. If you encounter a patient who does not meet the below requirements, but you are concerned about familial risk, then please contact the tertiary clinical genetics team at St Mary's Hospital MFT. Only patients meeting the below criteria should have a germline mutation blood test requested from secondary care.

Please ensure all request forms are completed correctly and are fully legible. It is especially important to add a legible email address for the requestor to ensure a timely return of results.
